Air, Noise and Environmental Hazards

Unit 2 followed water and waste. This unit turns to what surrounds everyone, all the time: the air and the sound, and then to the field that grew up to manage their dangers: health, safety and environment. It ends with the one tool that organises everything after it, the risk management cycle, which Unit 4 will take into whole workplaces.

Unit learning outcomes

By the end of this unit you should be able to:

- Explain the causes, effects and control strategies of air pollution.
- Explain the sources, human health impacts and control measures of noise pollution.
- Describe the HSE field and its idea of a hazard.
- Classify hazards as physical, mechanical, biological, chemical or psychological.
- Explain the link between health and environment, and what environmental safety means.
- Apply the hazard identification and risk management process to a real situation.

Prerequisite knowledge

Units 1 and 2 (the human-activity nexus; the source-pathway-receptor logic of pollution). The air-pollution chain in Topic 3.1 reuses Unit 2's chain with air in place of water.

In this unit

1. Air pollution
2. Noise pollution
3. Hazards in health, safety and environment
4. Risk assessment and management

How to use this unit

Work the topics in order: two pollution topics first, then the hazard framework they feed into, then the risk cycle that answers them. The activities use a phone (an air quality app and a sound meter app) and one walk around a building. Keep the notes: Unit 4's workplace audit builds directly on Topic 3.4's risk scoring.
