Water and Waste Management

Unit 1 ended with a rate: use below renewal. This unit follows the two things a city moves most, water and waste, and shows what happens when that rate is exceeded on both sides: too little clean water in, too much polluted water and solid waste out. It runs from the global water balance to a hospital's sharps bin, and every scale in between.

Unit learning outcomes

By the end of this unit you should be able to:

- Describe the distribution of water on Earth, and explain why a flooded district can still be water-scarce.
- Describe Pakistan's water resources and the challenges to its water security.
- Explain the sources, types, impacts and remedies of water pollution.
- Explain how industrial effluents are treated and recycled.
- Apply the principles of municipal solid waste management, including the waste hierarchy.
- Distinguish hazardous hospital and industrial waste from ordinary waste, and describe how each is managed.

Prerequisite knowledge

Unit 1 (natural resources, the human-activity nexus, the rate question). You should be able to name a renewable resource and explain what exceeding its renewal rate does.

In this unit

1. Water on Earth, and in Pakistan
2. Water pollution and industrial effluents
3. Solid and hazardous waste

How to use this unit

Work the topics in order: the first sets the supply, the second the pollution, the third the waste stream, and each builds on the one before. Keep your Unit 1 waste log running: Topic 2.3 asks you to re-read it as a waste stream rather than a personal habit. The activities need a water bill, a map of your neighbourhood and your school's bins, all ordinary things.
